Inspector Team: Bytes & Fabric Devs

Inspected Team: Infinite Loops

3. Background

The heart of the system is the seamless transition from product selection to completing the sale:

Footwear/Accessories Selection: The user browses the catalog for items.

Invoice Generation: The system immediately checks stock availability and calculates the total amount.

Payment Method Selection:

Cash Payment: The customer enters the amount paid, and the system automatically calculates the exact change to be given.

Stock Write-Down and Closure: The system deducts the units sold from the total inventory and issues the final receipt/invoice.

Although the Definition Project generally suggests the selection of alternative payment methods, contrasting this information with the SRS and the Product Backlog reveals that the system is strictly limited to handling cash payments exclusively. This discrepancy evidences a divergence in criteria between the initial deliverables and the normative structuring of the project
